NOTE	<ol style="list-style-type: none"> All parameters NOT specially mentioned are measured at 400VAC input, rated load and 25°C of ambient temperature. Ripple & noise are measured at 20MHz of bandwidth by using a 12" twisted pair-wire terminated with a 0.1uF & 47uF parallel capacitor. Tolerance :includes set up tolerance, line regulation and load regulation. During withstand voltage and isolation resistance testing, the screw "A" shall be temporarily removed, and shall be installed back after the testing. Derating may be needed under low input voltages. Please check the derating curve for more details. The efficiency is measured at 75% load and 480VAC input. The power supply is considered a component which will be installed into a final equipment. All the EMC tests are been executed by mounting the unit on a 600mm*900mm metal plate with 1mm of thickness. The final equipment must be re-confirmed that it still meets EMC directives. For guidance on how to perform these EMC tests, please refer to "EMI testing of component power supplies." (as available on https://www.meanwell.com/Upload/PDF/EMI_statement_en.pdf) The ambient temperature derating of 3.5°C/1000m with fanless models and of 5°C/1000m with fan models for operating altitude higher than 2000m(6500ft). If use PV signal to adjust Vo, under certain operations conditions, ripple noise of Vo might slightly go over rating defined in this specification. Under light load condition, output voltage ripple will exceed specification. The behavior can be minimized by increasing the load. <p>※ Product Liability Disclaimer : For detailed information, please refer to https://www.meanwell.com/serviceDisclaimer.aspx</p>

1. Peak Power

$$P_{av} = \frac{P_{pk} \times t + P_{npk} \times (T-t)}{T} \leq P_{rated}$$

$$\text{Duty} = \frac{t}{T} \times 100\% \leq 35\%$$

$$t \leq 5 \text{ sec}$$

P_{av} : Average output power (W)

P_{pk} : Peak output power (W)

P_{npk} : Non-peak output power (W)

P_{rated} : Rated output power (W)

t : Peak power width (sec)

T : Period (sec)

For example (115V model)

$V_{in}=380\text{VAC}$, $\text{Duty}_{max}=20\%$

$P_{av}=P_{rated}=30000\text{W}$

$P_{pk}=30000\text{W} \times 120\%=36000\text{W}$

$t \leq 5\text{sec}$

$$T \geq \frac{5\text{sec}}{20\%} = 25\text{sec}$$

$$P_{npk} \leq \frac{TP_{av} - tP_{pk}}{T-t} = 28500\text{W}$$

2. Output Voltage Programming (or, PV / remote voltage programming / remote adjust / margin programming / dynamic voltage trim)

(1) Default by potentiometer (SVR)

- (a) Have the DIP switch position-3 set as 
- (b) Output voltage can be trimmed by SVR.

(2) By Output Voltage Programming

- (a) Have the DIP switch position-3 set as 
- (b) The output voltage can be trimmed to 50~120% by applying EXTERNAL VOLTAGE between PV+ and PV- on CN53.

Fig 2.1

© The 100% output voltage is 48/115/216/334V.

© The rated current should change with the Output Voltage Programming accordingly.

Fig 2.2

3.Constant Current Programming (or, PC / remote current programming / dynamic current trim)

(1)Default Overload Protection(OLP) value

- (a)Have the DIP switch position-2 set as
- (b)Output current is set default value.

(2)By Constant Current Level Programming

- (a)Have the DIP switch position-2 set as
- (b)The constant current level can be trimmed to 1~100% of the rated current by applying EXTERNAL VOLTAGE between PC+ and PC-on CN53.

Fig 3.1

※ Under PC function at wattage < 10KW, the power supply might enter burst mode and cause output unstable, please increase the load to minimized the effect.

※ Auto de-rating function covered by over temperature protection, it works either in PC mode or under control by communication protocol.

T₁(Typ.): Maximum ambient temperature of full load.

T₂(Typ.): T₁+5°C.

Fig 3.2

◎ The 100% output current is 346/261/139/90A.

◎ It might cause higher current ripple when the output current adjust below 20%(@<1V programming)

4. DA, DB signal and parallel control function

(1) Non-parallel operation

- (a) set the DIP switch of position-1 as
- (b) By default, non-parallel operation.

(2) Default parallel operation

- (a) set the DIP switch of position-1 as
- (b) PSUs are configured in parallel operation.

5. Remote ON-OFF Control

※ The power supply can be turned ON-OFF by using the "Remote ON-OFF" function.

Between Remote ON-OFF(CN86 pin3) and 5V-AUX(CN86 pin4)	Output Status
Switch close (Short)	power supply ON
Switch open (Open)	power supply OFF

Table 5.1

Fig 5.1

6. Alarm Signal Output

※ There are 4 alarm signals, DC-OK, T-ALARM, Fan Fail and AC-OK, in TTL signal form, on CN86. These signals are isolated from output.

Fig 6.1

DC-OK & T-ALARM & Fan Fail Signal	Power Supply Status
"High" >3.5~5.5V	OFF
"Low" <-0.5~0.5V	ON

AC-OK Signal	Power Supply Status
"High" >3.5~5.5V	ON
"Low" <-0.5~0.5V	OFF

※ DC OK might mis-triggered when the voltage difference between PSU and the load, please minimized the unnecessary voltage difference.

7. Current Sharing

SHP-30K-HV has the built-in active current sharing function and can be connected in parallel, up to 12 units or more, to provide higher output power as exhibited below :

- ※ The power supplies should be paralleled using short and large diameter wiring and then connected to the load.
- ※ In parallel connection, power supply with the highest output Voltage will be the master unit and its Vout will be the DC bus voltage.
- ※ The total output current must not exceed the value determined by the following equation:
 Maximum output current at parallel operation = (Rated current per unit) x (Number of unit) x 95% ; when parallel unit less than 4 units.
 Maximum output current at parallel operation = (Rated current per unit) x (Number of unit) x [95% - (Number of unit - 4) x 2%] ; when parallel unit less than 12 units.
 If parallel unit more than 12 units. Please contact MW sales team.
- ※ When the total output current is less than 5% of the total rated current, or say (5% of Rated current per unit) × (Number of unit) the current shared among units may not be balanced. (Please refer to the current share dreading curve)
- ※ Under parallel operation ripple of the output voltage may be higher than the SPEC at light load condition. It will go back to normal ripple level once the output load is more than 5%.
